

Building a “backend-less” URL shortener

Eric Johnson

Sr Developer Advocate – Serverless Applications, AWS

Who am I?

- Eric Johnson - @edjgeek
- Sr. Developer Advocate – Serverless, AWS
- Serverless / tooling / automation Geek
- Software Architect / Solutions Architect
- Music lover
- Pizza / diet Dr. Pepper fanatic

Serverless web application

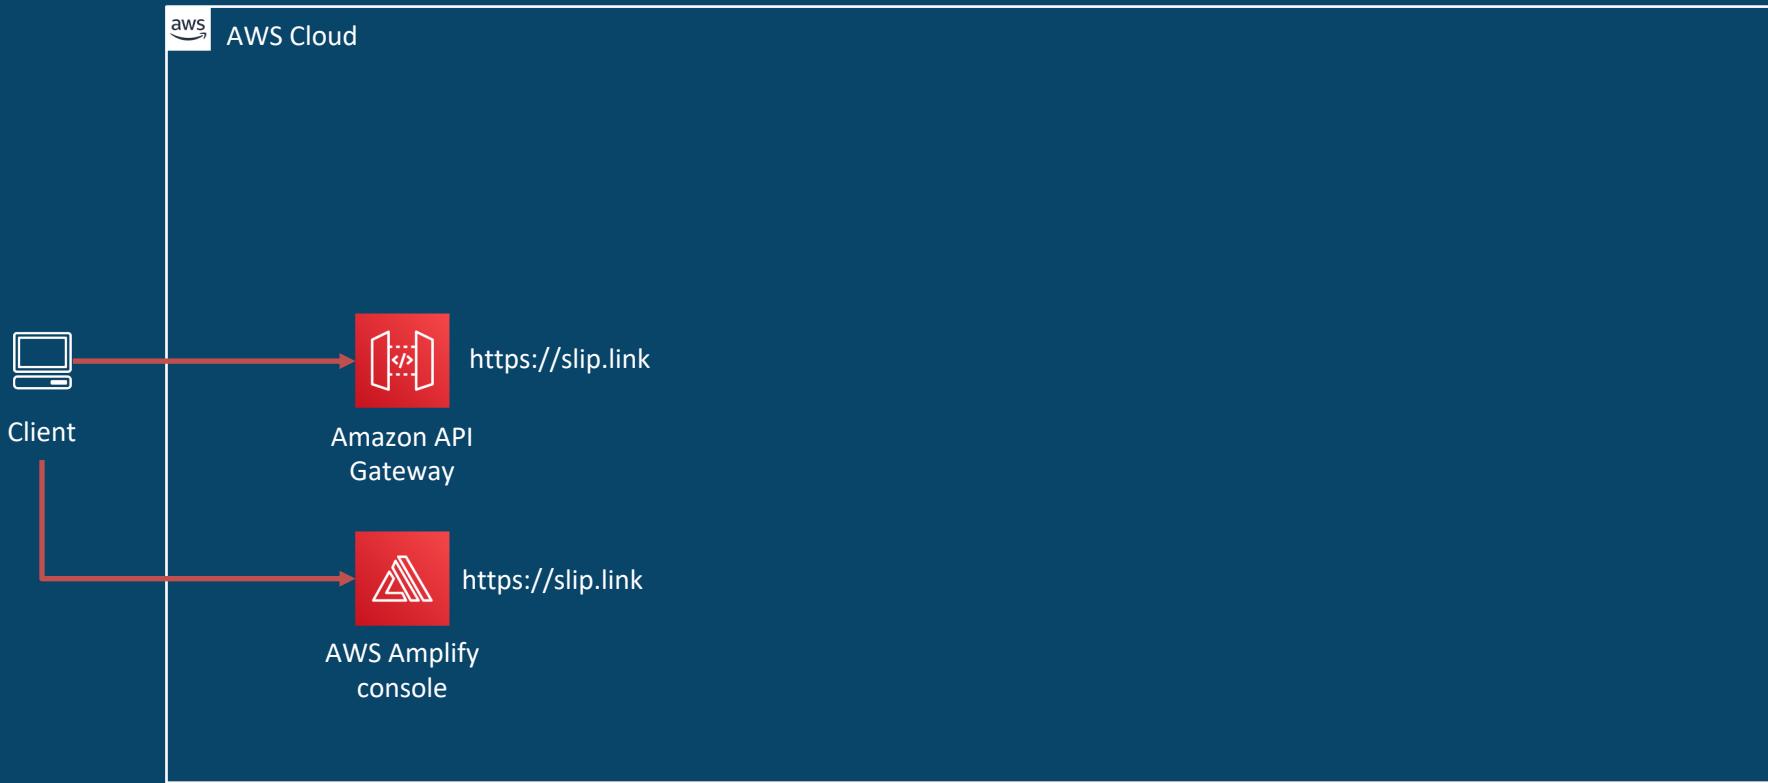

Client hosting

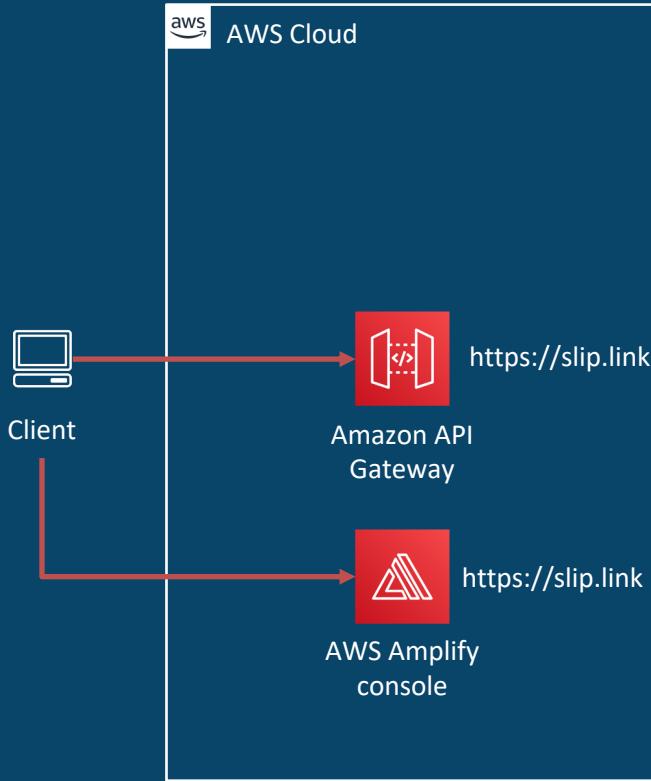

Client hosting

API management

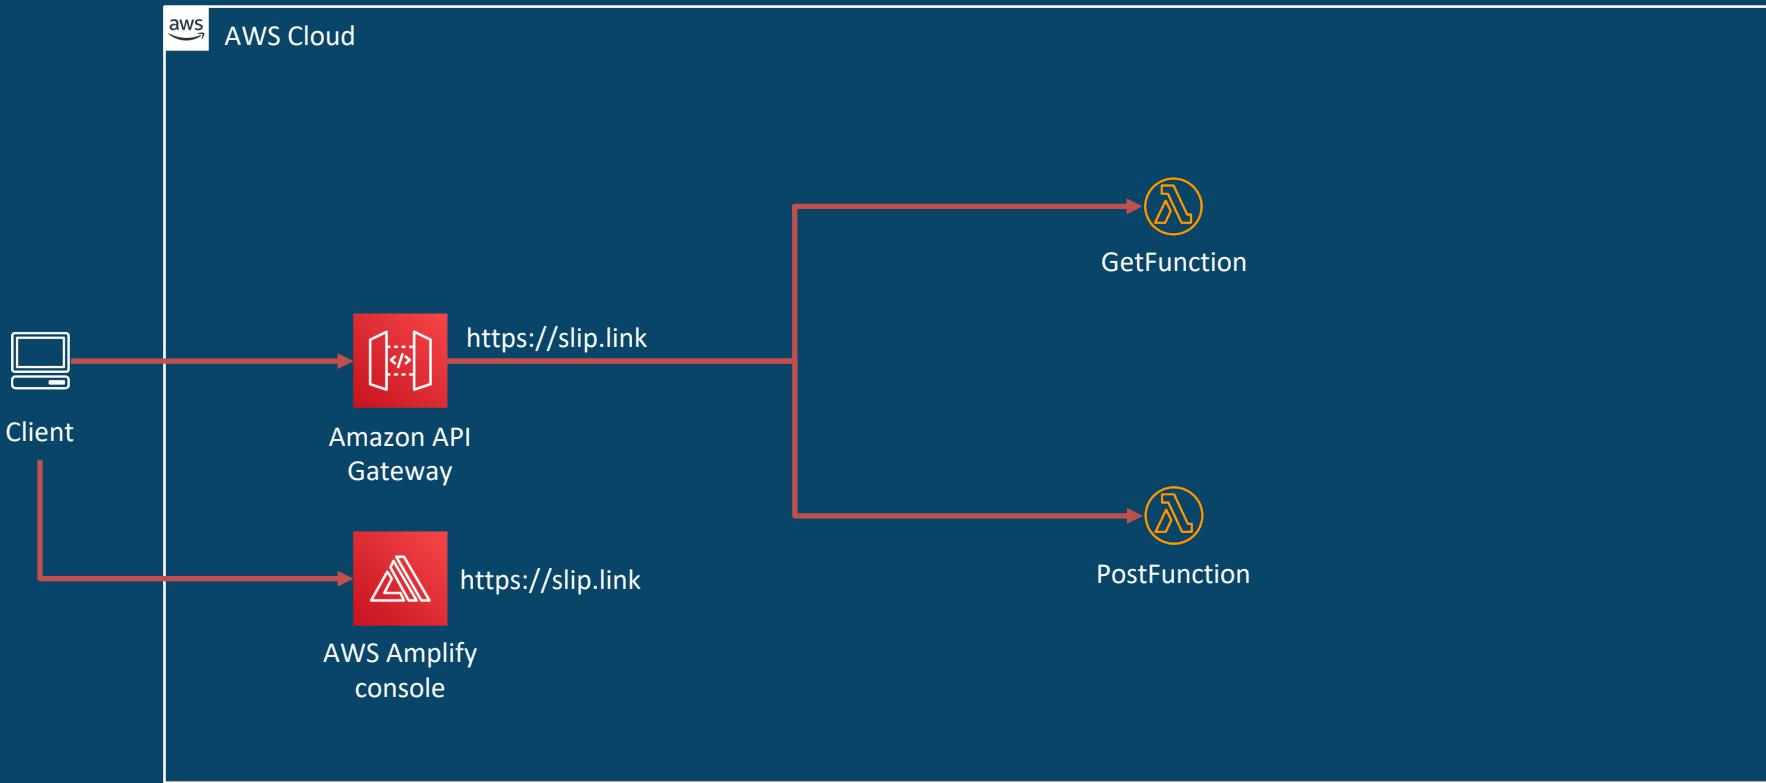

API management

Amazon API Gateway

- Authentication/Authorization support through authorizers
- Throttling
- Caching
- SSL offloading
- Custom domains
- Resource policies
- Request/Response modeling and validation

Backend

Backend

AWS Lambda

- Supports multiple languages natively
- Offers custom runtime for other languages
- Auto scales
- Pay for only what you use

Client

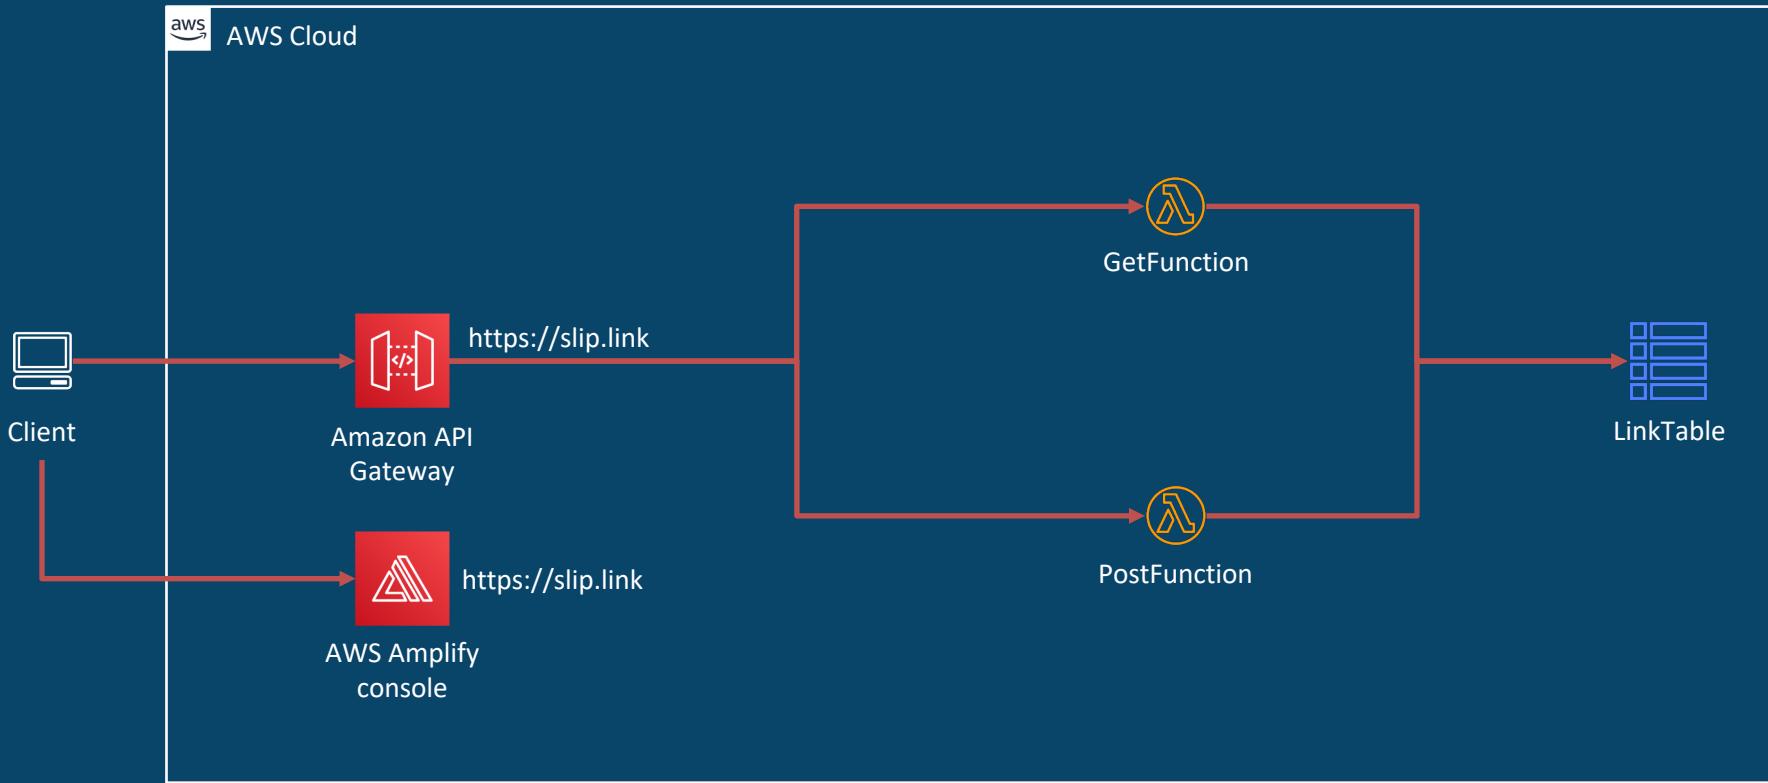

GetFunction

PostFunction

Data storage

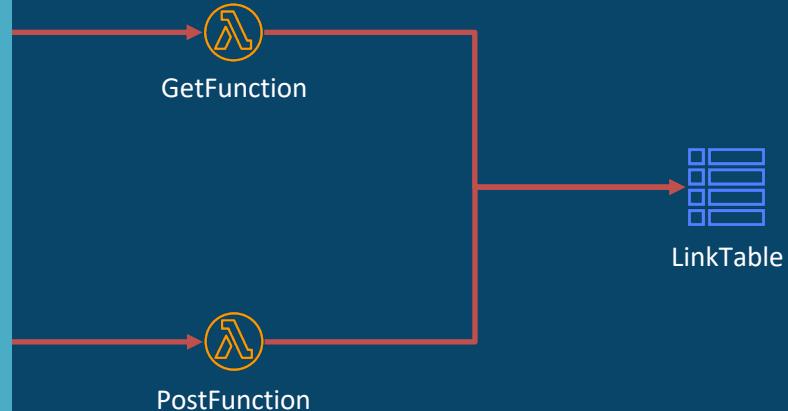

Data storage

Amazon DynamoDB

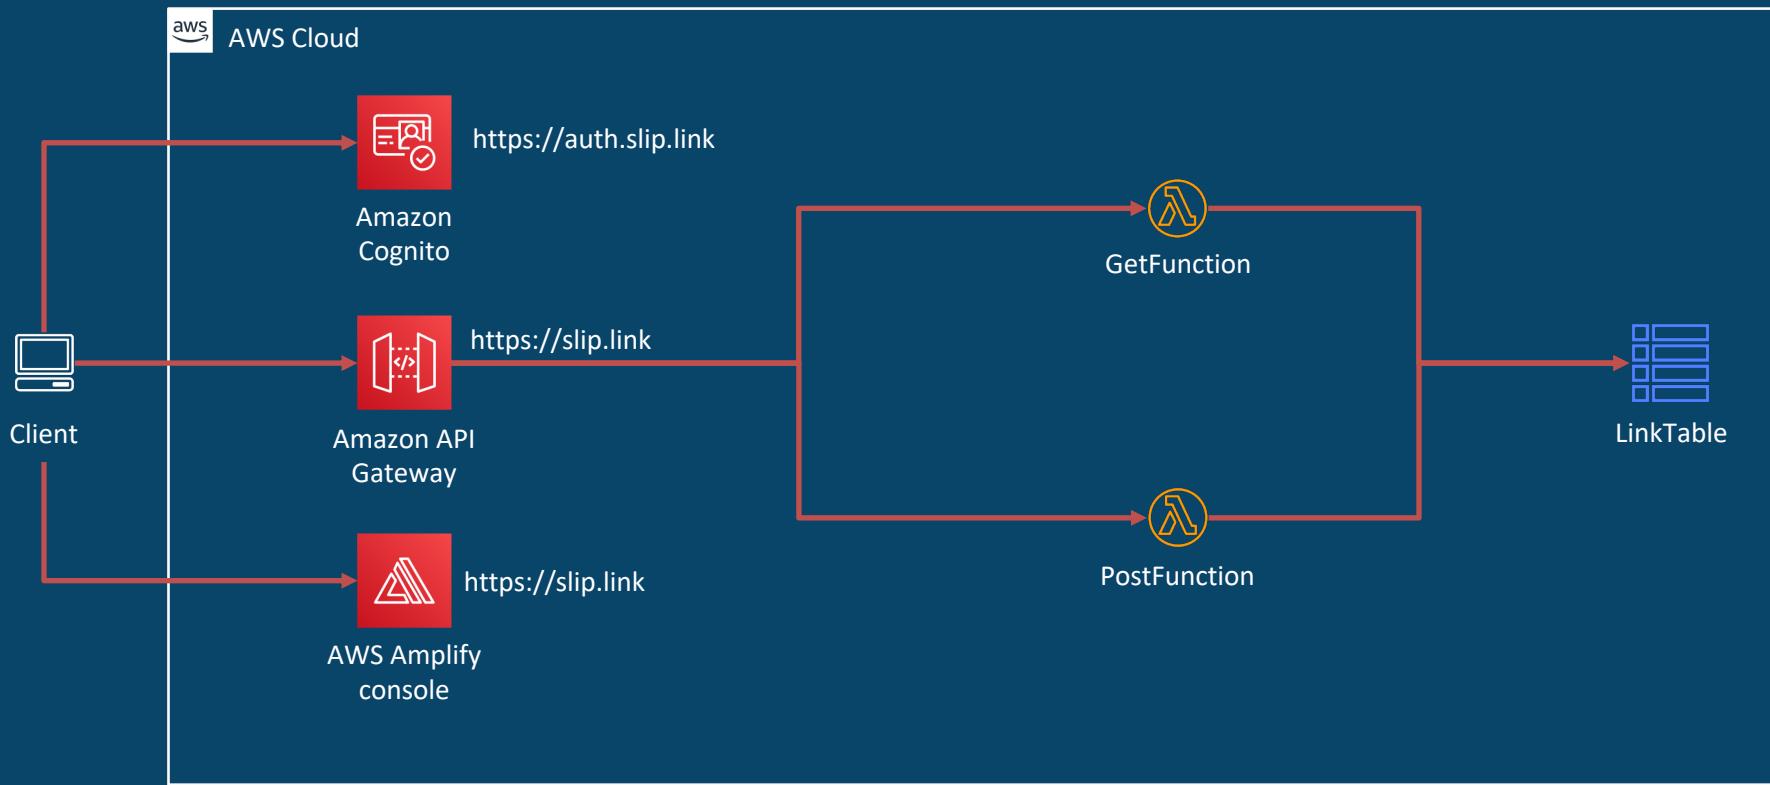

- DynamoDB
- Key/Value store
- Highly scalable
- Highly durable
- Global, multi-master tables
- API access

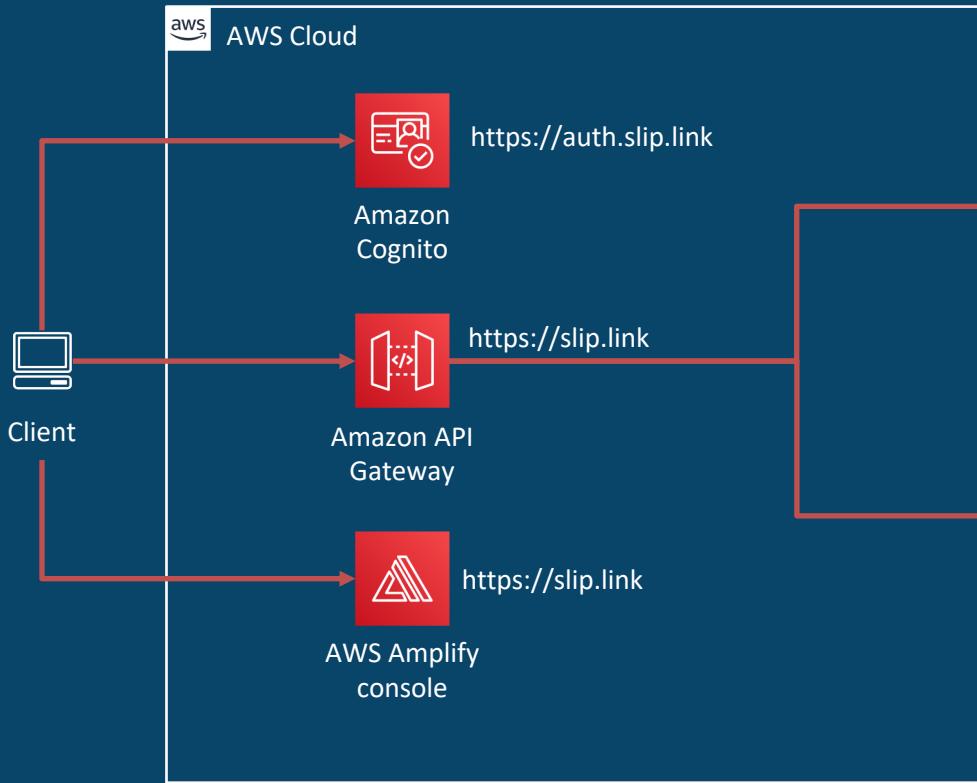

Client

Security

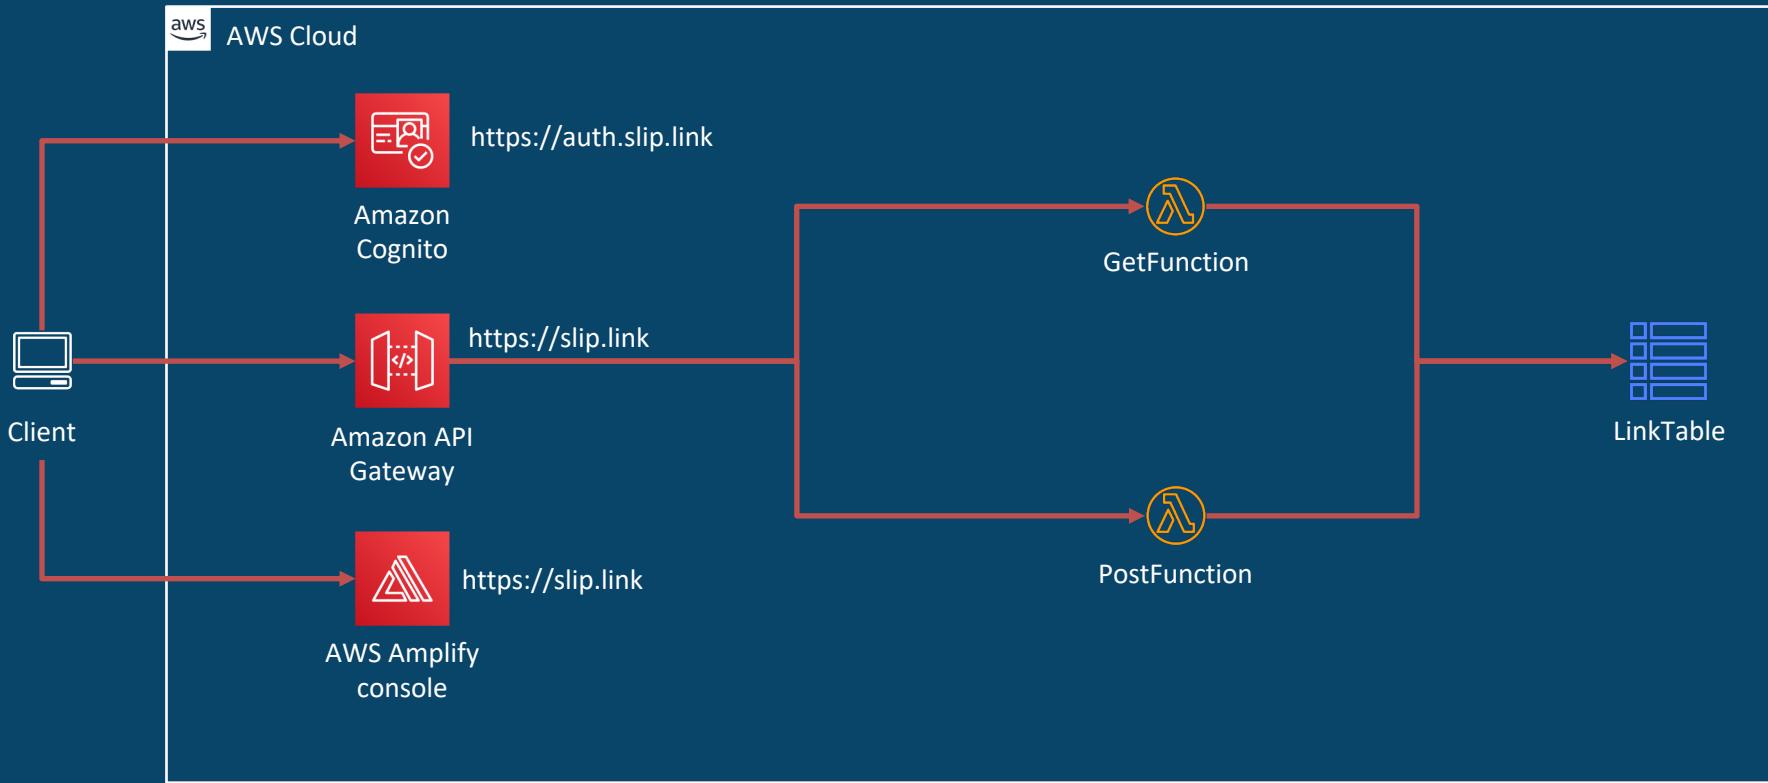

Security

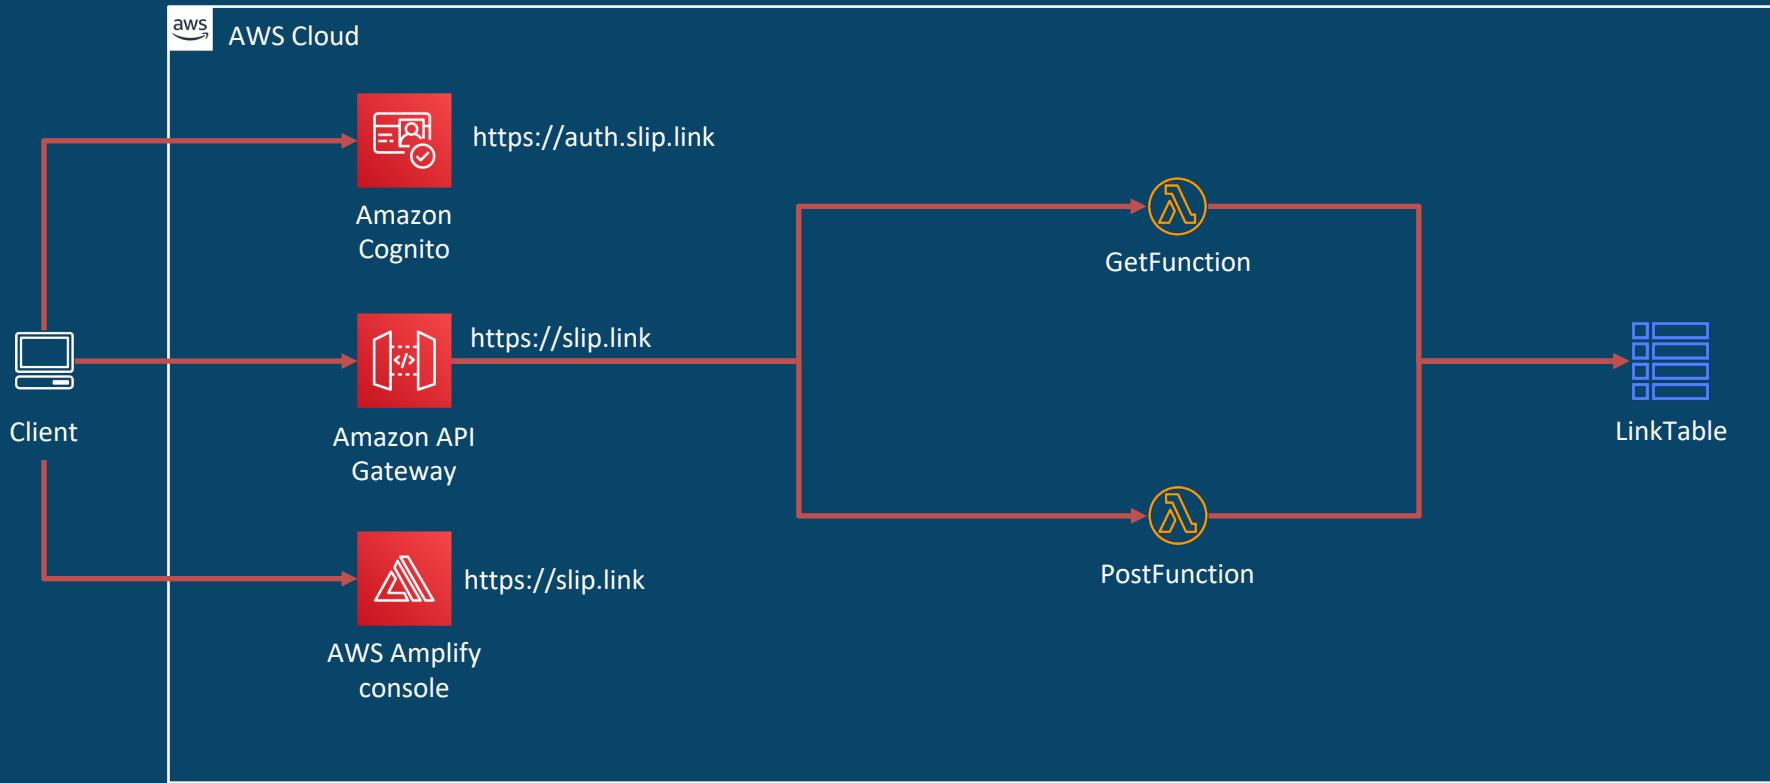

Amazon Cognito

- User pools
- Federated identity
- Hosted login pages
- Custom domains
- Scopes

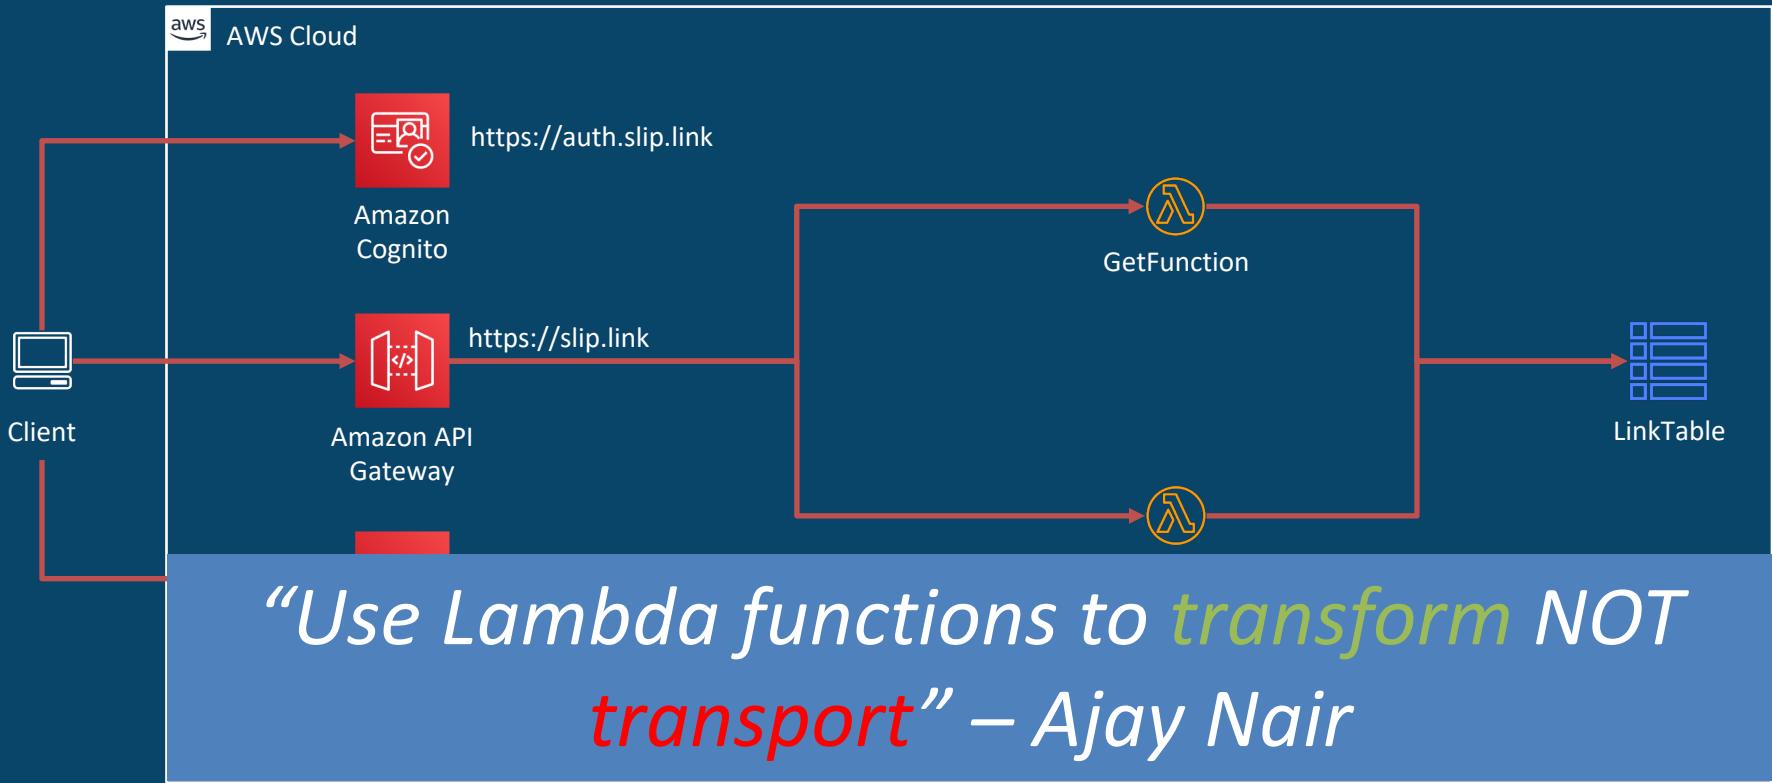

The whole picture

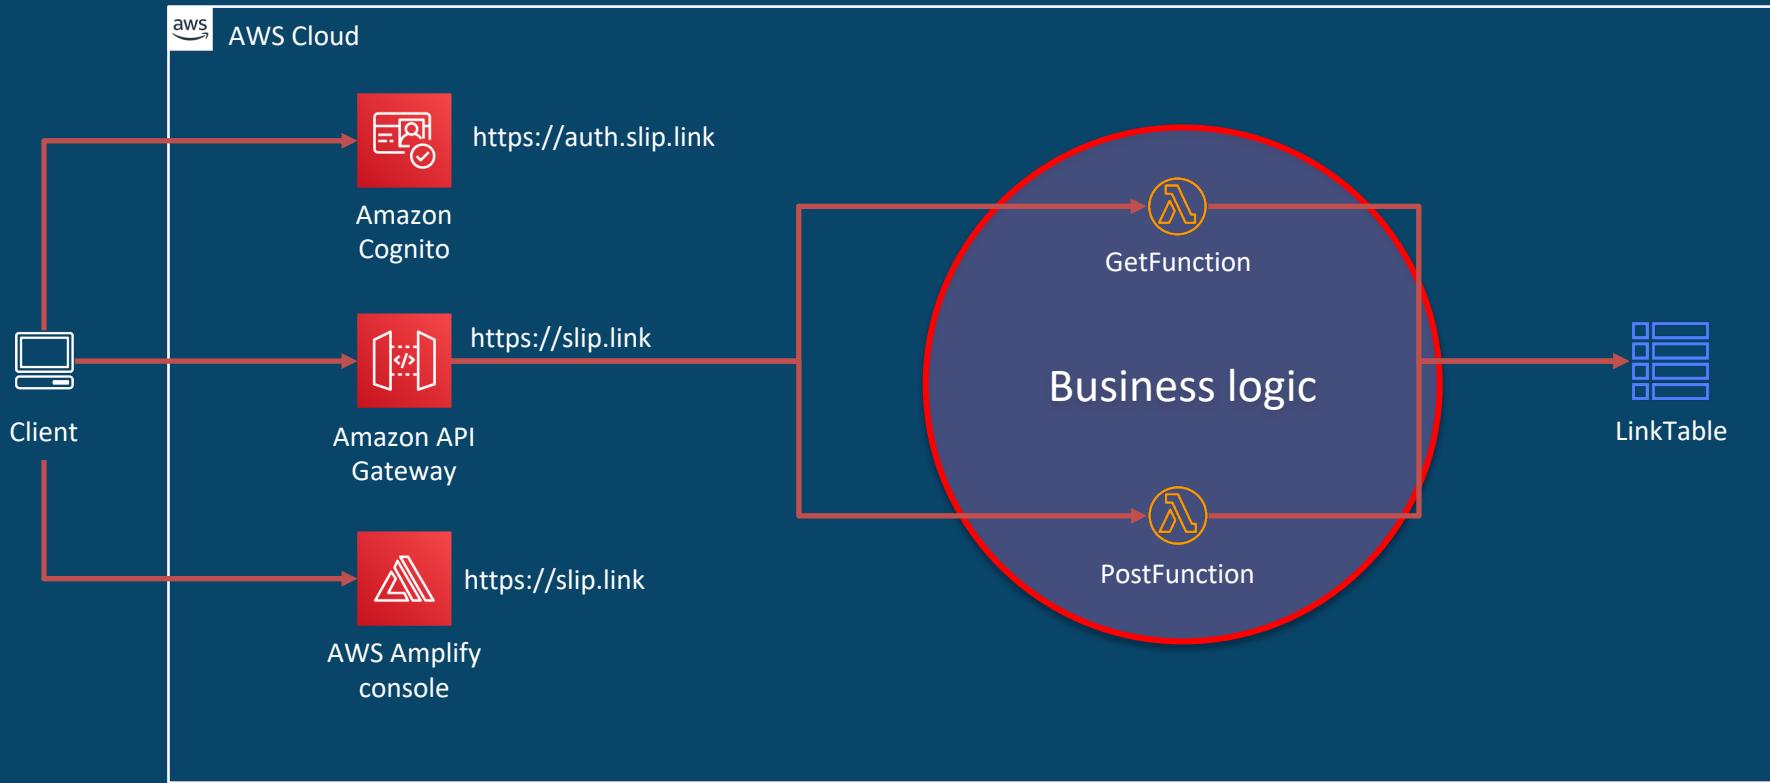

Transport or transform

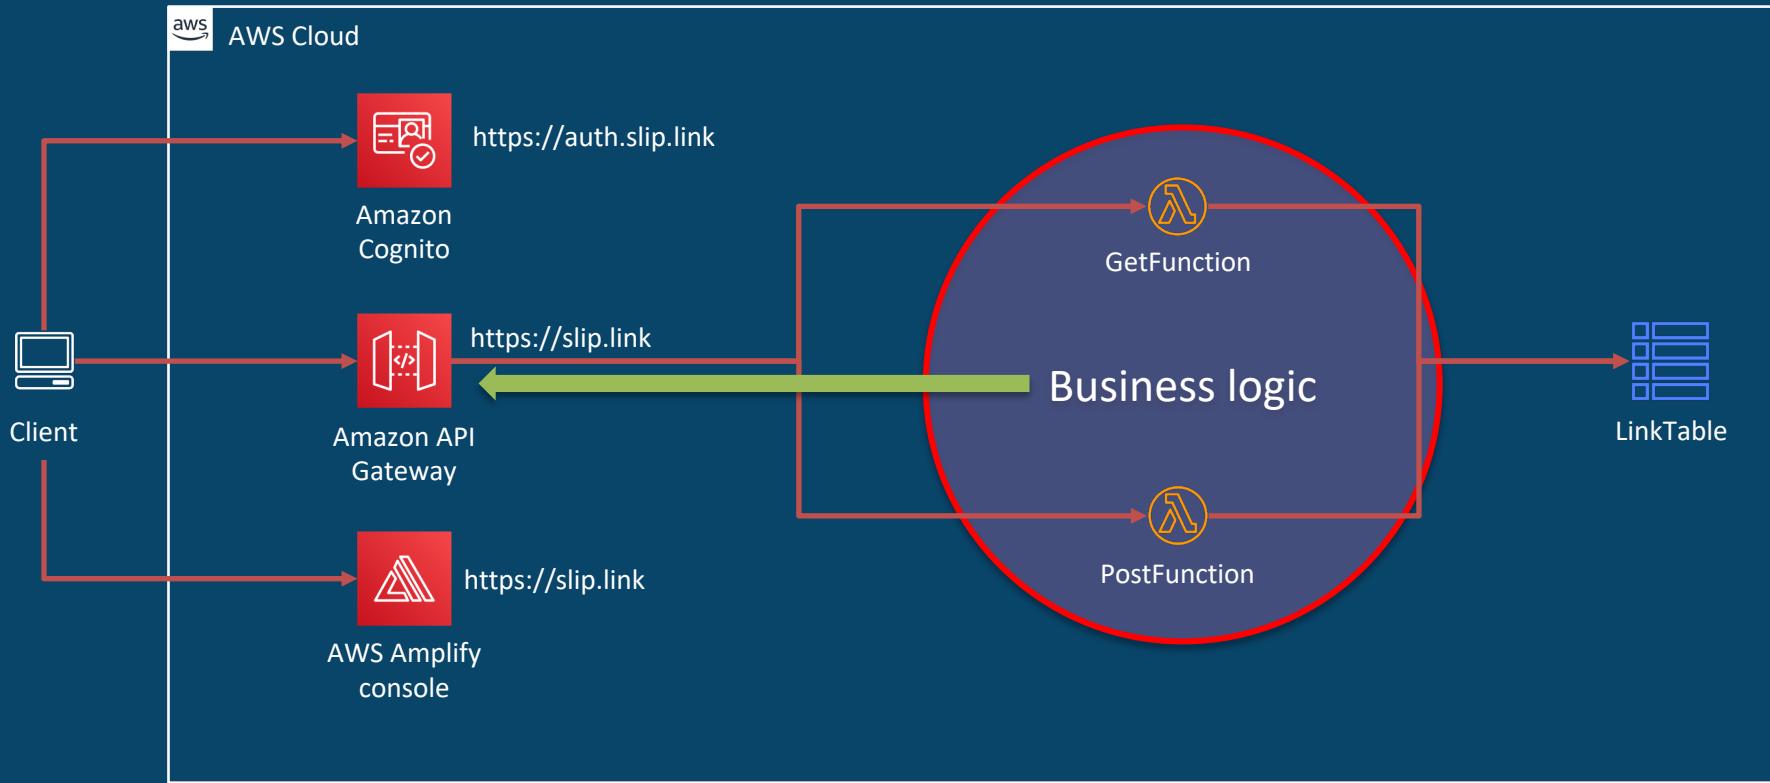

Transport or transform

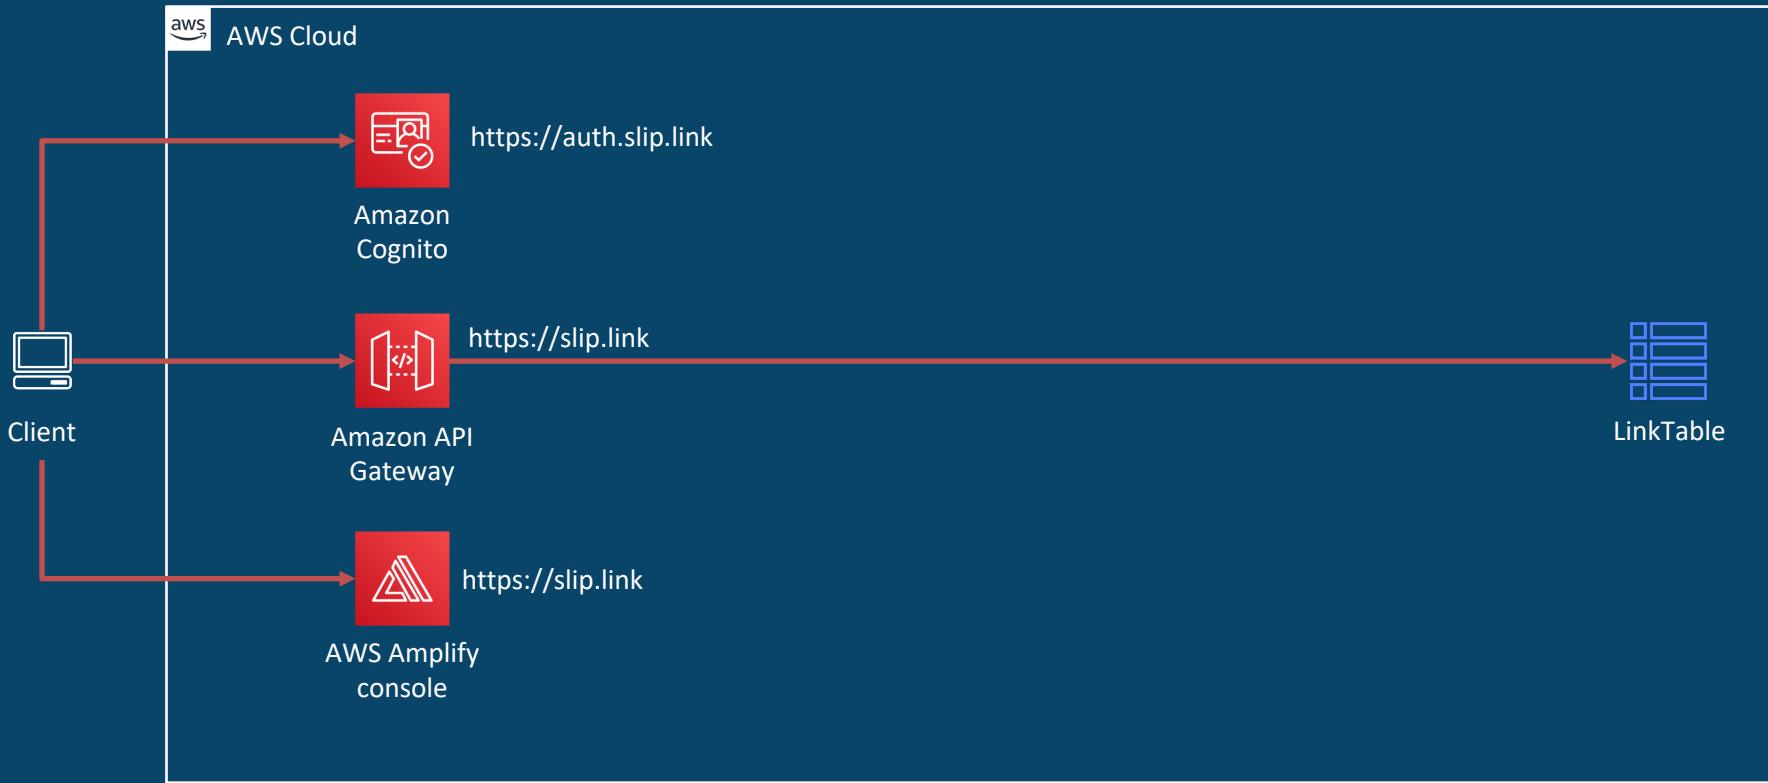

Do we even need these?

Relocating business logic

What we are going to build

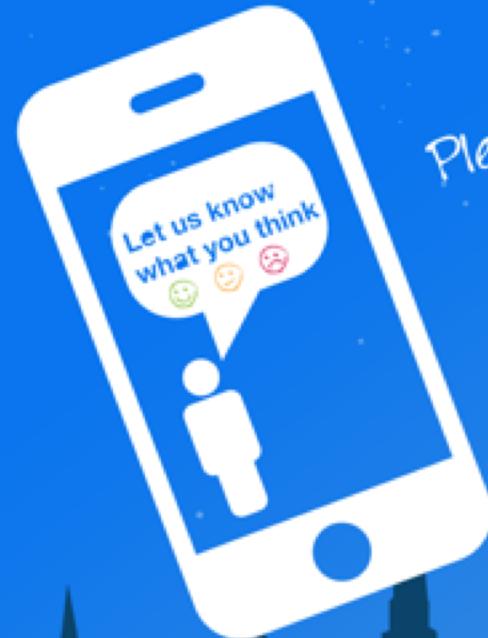

Expectations

- POC
- Happy path only
- Not a move to replace Lambda
- Understanding of the power of API Gateways
- Gain an understanding of the right tool for the job

Let's code
